Fed up?

Computers have become fast, but using them has become slow. Updates, accounts, ads, subscriptions and the fear of making a mistake. Neo was made to get all of that out of the way.

FED UP WITH	NEO OFFERS
Updates that interrupt your work and restart the computer when you need it most	Renewal asks once, prepares in the background and rolls back to the old version with one click.
Drivers, versions and “this device is not supported”	One system image with all the drivers. For the user, drivers simply don't exist.
A computer that takes as long to start as making coffee	The system in ROM and Chronos: the desktop in a second or two.
Ads, offers and “recommendations” inside the system itself	No ads. No subscriptions. Bought means bought.

AND MORE

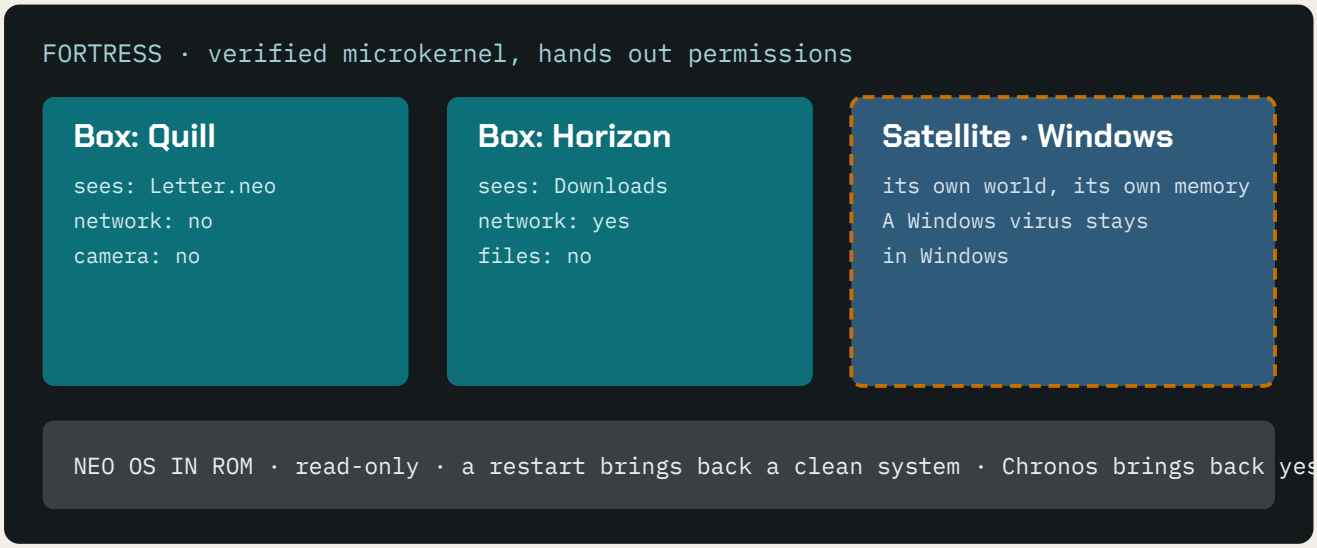

What you stopped expecting

FED UP WITH	NEO OFFERS
An account for everything and tracking of every click	Works without an account and without telemetry. Lock shows who sends what from your machine.
A camera and microphone you can't tell are on or off	Physical switches and an indicator light that software cannot turn off.
A disk that fails and takes the whole system with it	The OS in soldered ROM, data mirrored on two disks and Guardian for backups.
A computer that becomes obsolete in three years	Ten years of updates, repair at home and a new board in the old case.
Old games and programs that no longer work	FPGA cores, Satellite for Windows and cartridges that work instantly.
Monthly subscriptions for office work and video editing	Quill, Abacus, Montage, Wave and Album come in the box.
Cyrillic as a second-class citizen	Both scripts equal, transliteration of the whole system with one switch.
The fear that you will break something	Unlimited undo, in a document, a file and the whole system.

PROTECTION

Viruses? Locked in a box.

On today's systems a program you run can do anything you can. On Neo every program gets only what you give it.

Every program in its own box

A program sees only the files you give it through the open dialog. No access to the rest of the disk, the camera or the network without your permission.

Macros and documents

A document opens in a box without network access. A macro from an email cannot run anything outside that document.

The system cannot be infected

The OS is in ROM and is read-only. A virus cannot nest in the system, and a restart always returns it to a clean state.

The network under watch

Lock sees every outgoing packet per program and stops labelled files from being sent.

Honestly: the risk is not zero. No system can fully prevent fraud through a fake message, and there will be bugs in the code. That is why Renewal ships patches, and the damage from a successful attack stays locked in one box.
